EDUCATION

BS in Information Technology, University of Central Florida — Expected Graduation: Fall 2026

SKILLS

Languages: Lua, GLua, Python, HTML, CSS, SQL, Java, JSON

Tools & Platforms: MySQL, PhpMyAdmin, Apache, Django, Git, Filezilla, Putty, Source Engine, Hammer, Unity, Unreal Engine 4-5

Systems: Linux (VPS deployment & administration), Windows

PROJECTS

Game Player Database — Independent Project

- Built and managed a full-scale SQL database for a game created in collaboration with a content creator, scaling to support **50,000+ registered players** and **millions of data entries** as the community rapidly grew.
- Designed normalized table structures with stored procedures and data import/export pipelines to handle high-volume player data reliably under production traffic.
- Wrote custom Lua scripts to interface with the database in real time, enabling efficient retrieval and updating of player records for concurrent users across the live server.
- Deployed and configured a **Linux-based VPS** from scratch, installing and maintaining MySQL, Apache, and Git to host the production database environment.
- Established role-based MySQL user permissions with distinct access levels and integrated PhpMyAdmin for streamlined front-end database management.

Game Server Administration & Creation — Freelance / Independent Project

- Oversaw setup, configuration, and ongoing maintenance of multiplayer game servers, sustaining **99%+ uptime** across environments serving thousands of active players.
- Performed routine troubleshooting and performance tuning to guarantee server stability and uninterrupted gameplay during peak traffic periods.
- Maintained comprehensive documentation and version control for all server configurations and modifications, keeping up-to-date with industry best practices in game server administration and security.
- Utilized **Oracle VirtualBox** to build and manage a local network of virtual machines running **Windows Server OS**, simulating multi-server environments for testing, configuration practice, and network administration.

Custom Computer Building & Hardware — Hands-On Experience

- Personally built **multiple custom computers** from the ground up, selecting and assembling components including CPUs, GPUs, motherboards, RAM, storage drives, power supplies, and cooling systems.
 - Developed a thorough understanding of computer architecture and how hardware components interact at the system level, including BIOS/UEFI configuration, driver management, and boot processes.
 - Diagnosed and resolved hardware issues such as thermal throttling, boot failures, and component incompatibilities, applying structured troubleshooting methodologies.
 - Stayed current with hardware trends and specifications to advise on cost-effective, performance-optimized builds tailored to specific workloads including gaming, development, and server hosting.
 - Assembled and configured a dedicated **server computer** to support a machine learning project called **Simple Train**, selecting hardware optimized for ML training workloads and setting up the environment end-to-end.
 - Developed backend functionality for Simple Train using **Django**, building **REST APIs** to facilitate communication between the front end and the ML pipeline, handling data processing and model interaction.
-

WORK HISTORY

Game / Program Freelancer — Everyday AS 2017 – Present

OS Rep — Onesupport June 2023 – August 2023

Host — Red Lobster January 2018 – July 2019
