■ PORTFOLIO

dylan223.github.io

EDUCATION

B.S. Information Technology, University of Central Florida

Expected Fall 2026

SKILLS

Languages	Lua, GLua, Python, C, C++, Java, SQL, HTML, CSS, JSON
Tools	MySQL, PhpMyAdmin, Apache, AWS, Django, Git, FileZilla, PuTTY, Source Engine, Hammer, Unity, Unreal Engine 4/5
Systems	Linux (VPS deployment & administration), Windows, VirtualBox, REST APIs
Certifications	CompTIA Network+

PROJECTS

Gentoi.online — Custom Web Platform & Game Server Gateway

gentoi.online

- Designed and built a full-stack web platform from scratch as the operational frontend for an active multiplayer game server, currently serving 4,000+ monthly active players and 80,000+ lifetime players.
- Implemented Steam OpenID authentication, a transactional package store driving 2,000+ purchases, a public bans registry, and live player statistics pulled directly from gameplay data.
- Architected and tuned the backing database that powers every account signup, transaction, ban record, and stat aggregation surfaced through the site.
- Deployed and maintained the full stack independently (frontend, backend, database, and Linux server infrastructure).

Game Player Database — Production SQL Backend

Independent Project (with content creator)

- Built and managed a full-scale SQL database for a game developed alongside a content creator, scaling to 50,000+ registered players and millions of data entries as the community rapidly grew.
- Designed normalized table structures with stored procedures and data import/export pipelines for reliable high-volume player data under production traffic.
- Wrote custom Lua scripts to interface with the database in real time, enabling efficient retrieval and updating of player records for concurrent users across the live server.
- Deployed and configured a Linux-based VPS from scratch, installing MySQL, Apache, and Git, with role-based MySQL user permissions and PhpMyAdmin for streamlined front-end database management.

Game Server Administration & Workshop Content

Freelance / Independent Project

- Oversaw setup, configuration, and ongoing maintenance of multiplayer game servers, sustaining 99%+ uptime across environments serving thousands of active players.
- Authored original NPCs and Nextbots for Garry's Mod (Source Engine) with custom AI behavior, animation work, and effects coded in Lua/GLua, totaling 300,000+ Steam Workshop subscriptions.
- Utilized Oracle VirtualBox to build and manage a local network of virtual machines running Windows Server OS, simulating multi-server environments for testing and network administration.

Custom Computer Building & Simple Train ML Backend

Hands-On Hardware & Backend Work

- Personally built multiple custom computers from the ground up, including a dedicated server PC optimized for ML training workloads supporting a project called Simple Train.
- Developed backend functionality for Simple Train using Django, building REST APIs to facilitate communication between the front end and the ML pipeline.
- Diagnosed and resolved hardware issues such as thermal throttling, boot failures, and component incompatibilities using structured troubleshooting methodologies.

WORK HISTORY

Game / Program Freelancer	Everyday AS	2017 – Present
Operating Systems Support	Onesupport	Jun 2023 – Aug 2023
Host	Red Lobster	Jan 2018 – Jul 2019
